Filhantering

I wrote a method printToFile()
with try catch for take care of errors and even display what kind of error it is.
Inside the try catch I have use the "using" method to take care of the stream
(open,close,exceptions)And of course an extra close so the file does not suddenly close incorrectly.

```
public void printToFile()
      {
          int counter = 1;

          System.Console.WriteLine("\nPrinting to file: ");
          try
          {
              using (StreamWriter streamWriter = new StreamWriter("petlist.txt", true))
              {

                  foreach (Animals pet in Pets)
                  {

                      streamWriter.WriteLine("{0}. {1}", counter++, pet);
                  }
                  streamWriter.Close();
              }
          }
          catch (System.Exception e)
          {

              System.Console.WriteLine(e.Message);
          }
```
